How to write classes in Python?

 **You:** How to write classes in Python?

🤖 **AI:** To write a class in Python, use the `class` keyword followed by the name of the class (which should start with an uppercase letter) and include indentation for nested content. Begin your docstring using triple quotes (`"""`) right beneath the class definition or after other decorators like `@property` . Inside the method bodies, ensure to begin each statement on a new line without semicolons at the end of statements as Python does not require them. Here's an example:

```
class MyClass:
    """This is my own custom object.""" # Docstring with triple quotes for docume

    def __init__(self, param1):
        self.param1 = param1 # An instance attribute initialized in the construct

    def a_method(self):
        result = self.param1 * 2
        return result # Returning and not using semicolons at end of statements a
```
